The objective of this research is about the education level and to have a knowledge development behavior and personal health care in the district of Bangkhae Bangkok. All together the students which were included were of a level about the knowledge development Personal and family health care, be compared into our daily life to get a Proper Knowledge of Oneself and to have proper health about ourself. To be distinguished between the different Sexes and age differences between in individuals. The Age factor of the education and their Careers.

This research deals with a proper Survry which was obtained from the sample group. The medical services about each individual which included the company Human touch which carried on the medical survey also included is BigC Petchkasim. And the people who live within the area which includes the Community of mooban Setakit. If the distribution of the Questionnaire which was used to gain Some information. There were a total of 4 group the first group were about 100 people. They belonged to the government officials the second group of 100 student from different schools and Institutions. The third group of 100 were housewives and senior citizens. The total number of people who were sampled were about 400 people. After the

Questionnaire was collected the results showed that the statistical processing the frequency distribution Percentage average standard deviation which showed the compared analysis used statistics and t- test. The results obtained showed a one way Analysis of variance of the total sum.

The sample group which was taken were the male gender more than the female gender with the age gap of between 21 to 29 years. Including their professions of government officials and students, Housewives and senior citizens graduates. The salary of these above mentioned groups of people 10,001 to 20,000 baht from here the sample of the group which had the knowledge development and personal health care which was at the highest due to their involvement in physical Exercise and the cultural influence which had their attitudes which were at the lowest because of their Personal health care.

The sample group in this research comes from the social influence and the difference between the different attitudes between the knowledge development behavior and Personal health care which was found at a significant level of 0.05 factor. The sex, age, job, and educational status was found to be at the lowest level. There wasn't any difference in the knowledge development factor.

Knowledge development behavior and Personal health care include the emotions and the society and physique. And attitude and the Personal health consciousness. Knowledge development with the knowledge development of the family background. The level stood at significant level of 0.05

This deep research study of the knowledge development and Personal health care behavior at the district of Bangkok. The Guidelines used to solve the Problems and the Potentiality of the knowledge development increased a lot in Personal care and the family health care too. Altogether the knowledge development and the Introduction of Personal hygiene which was correct.
